

# Advantages of Optical Splitters and Optical Switches

## Overview

**Zero Power Consumption:** Operates purely on optical physics. **High Reliability:** No electronic parts means fewer points of failure. **Predictable Loss:** Optical attenuation is constant and easy to calculate. **Cost Efficiency:** Low CAPEX and almost zero maintenance costs. Optical splitters represent a more established technology with passive 1×N and 2×N configurations dominating the market. 5 dB to 17 dB depending. By dividing a single optical signal from a central Optical Line Terminal (OLT) into multiple outputs for Optical Network Terminals (ONTs) at users' homes, splitters eliminate the need for dedicated fibers to each residence—slashing infrastructure costs while scaling network reach. Within these networks, splitters play a crucial role in directing and managing light signals. Splitters are passive optical devices that divide or combine. An Optical Splitter, also known as a beam splitter, is a passive optical device that divides a single input optical signal into two or more output signals.
