

Cable tray deformation under load

Overview

All profiles deflect when a load is imposed. The deflection of cable tray is related to applied load, support span, size and material of beam and load. Imposed loads include wind, ice and snow. The mechanical and electrical characteristics, tests, certifications, overall quality management, recommendations mentioned in this technical guide only apply to our own cable management ranges and cannot under any circumstances be transposed to silicone, overheating or. Cable Tray Selection - Strength Deflection Deflection in a cable tray system is primarily an aesthetic consideration. UNIVERSAL has developed a simple seven-step process to guide you in the process: Each step is described in detail below. For many applications, however, you may also have to take the following into account: Weight. Cable tray load testing ensures your trays can hold the weight without bending or breaking. This is critical for safety, ensuring your electrical and data cabling systems. IEC 61537 is the international standard developed by the International Electrotechnical Commission (IEC).
