

Deep burial depth of distribution box cables

Overview

Most direct-buried cables need to be at least 24" deep. Conduit depths depend on the type and where you're installing it. Here are the most common field scenarios: if there's any chance a vehicle will drive or park over the trench location—24" min required. Estimate minimum burial depth (cover) for underground electrical, fiber, and low-voltage cable runs using a practical, code-aware ruleset. Use this calculator to estimate a minimum burial depth. Some cables are designed specifically to be buried and have their own extra protection, such as steel wire armoured (SWA), as displayed in Fig 1. Exception: For one- and two-family. The use of unarmoured cables, such as HO7RN-F rubber flexible cables or unarmoured XLPE cables buried in the ground, is becoming more popular, especially for DC string wiring of photovoltaic (PV) systems and for certain interconnections in electric vehicle (EV) charging installations.
