

Distance between distribution box and operating platform

Overview

The distance between the distribution box and the switch box should not exceed 30 meters, and the horizontal distance between the switch box and the fixed electrical equipment it controls should not exceed 3 meters. They cover safe working distances for electrical work, including maintenance and operations and zero-voltage verification (ZVV). This space is necessary not only to. Electric utilities design electric power generation, transmission, and distribution installations to meet National Electrical Safety Code (NESC), ANSI C2, requirements. Electric utilities also design transmission and distribution lines to limit line outages as required by system reliability. To be honest with you, the planning and installation of LV switchgear is a damn complicated job.
