

# Do fiber optic sensors really rely on inversion

## Overview

Fiber optic current sensors work by detecting changes in light as it interacts with a magnetic field created by an electrical current. These sensors rely on the Faraday Effect, which occurs when a magnetic field causes a rotation in the polarization of light passing through an. As an advanced real-time monitoring technique, optic fiber downhole sensing has been widely applied in monitoring fracture propagation during hydraulic fracturing. However, existing fracture shape inversion methods face two main challenges: firstly, traditional methods struggle to accurately. Full-waveform inversion (FWI) is a powerful imaging technique that produces high-resolution subsurface models. In seismology, FWI workflows are traditionally based on seismometer recordings. Radiation absorption creates electronic excited states that are trapped by localized defects for extended periods of time.
