

Does a 6-core optical fiber cable have multimode capability

Overview

These cables contain fibers that can carry multiple light modes or paths, enabling them to transmit a higher volume of data simultaneously. Typically, they possess a larger core diameter, generally within the range of 50 to 62. Specifications are correct at time of printing and subject to change or alteration. Multimode Fiber (MMF) has a core diameter, typically 50-100 micrometers, has ability to transfer multiple modes of light through the fiber core, uses lower-cost electronics (LED, VCSEL) operates at the 850 nm and 1300 nm wavelength and is used for short distance interconnections (up to 550m). Multimode fiber optic cable, on the other hand, has a larger diameter core, typically 50 or 62. The equipment used for. There are five main types of multimode fiber, standardized by ISO/IEC 11801: OM1, OM2, OM3, OM4 and OM5. Mouser offers inventory, pricing, & datasheets for 6 Fiber Multimode Fiber Optic Cables.
