

Does your enterprise fiber optic network not have a router

Overview

If your business requires the symmetrical gigabit speeds and minimal latency of a fiber-optic connection, then a fiber router is not just an option—it's a requirement. When setting up an enterprise network, choosing the right hardware is a foundational step. You'll often encounter terms like "fiber router" and "normal router," which can seem interchangeable at first glance. However, their core functions and ideal use cases are tied directly to the type of connection. While modems connect directly to your ISP and convert their signals into usable internet for your business, routers take that internet connection and distribute it to the devices on your network. What Is a Router?

A router. A fiber router is designed to work specifically with fiber optic internet connections, providing faster and more reliable speeds compared to a normal router that typically works with traditional broadband connections. This option provides blazing-fast speeds and high bandwidth for efficient operations. Therefore, the ONT has one or more ports for routers, computers, or other user devices to connect to.
