

Grounding busbar of AC power distribution box in computer room

Overview

The grounding busbar is the backbone of a rack's grounding system. Typically made of copper or aluminum, it provides a central connection point for all ground wires within the rack. 1) Unit sub's neutral bonded to the grounding electrode system and frame of unit sub per NEC separately derived system (they aren't services). 3) Equipment grounding conductor and neutral run to. At the heart of a good grounding scheme is the ground bus bar: a solid, low-impedance conductor that ties all equipment grounding conductors (EGCs) together and connects them to the grounding electrode system. Rather than leaving stray green or bare wires looping around a panel, a ground bus bar. Purpose: Equipment grounding protects personnel and equipment by providing a low-resistance path for fault currents, such as those caused by short circuits or insulation failures, preventing electric shocks or equipment damage. Connection: Neither the positive nor negative DC conductor is directly. AI workloads, GPU clusters, and high-performance computing are pushing server rack power density to new extremes — from the historical 5-7 kW per rack to 20-40 kW or more. The traditional data center was.
