

Grounding of the power distribution box in the production workshop

Overview

Grounding of the units: Attach a ground wire from one of the threaded studs (A) at the bottom of the housing, to the mounting plate (B). The ground resistance. In this workshop, we will demystify the concepts of grounding as applicable to utility networks and industrial plant distribution systems as well as their associated control equipment. In fact, a lot of myths have been built around this subject, although it is quite a simple one when approached. Power from factory ground must be installed by a qualified electrician. Each DISTRIBUTION BOX and controller must be grounded. 26 mm² (10 AWG) ground wire must be used, and in all other markets a 6 mm² must be used. Grounding is necessary to assure correct operation of electrical devices, to assure safety. Grounding is a cornerstone of safety and performance in industrial electrical and electronic systems. Industrial electrical grounding requirements aren't just regulatory checkboxes—they're the foundation of.
