

# Grounding of the three-level distribution box body

## Overview

Attach a ground wire from one of the threaded studs (A) at the bottom of the housing, to the mounting plate (B). The ground resistance between all system parts shall be  $< 1 \Omega$ . Grounding is a mechanism to protect distribution equipment and people under normal operating conditions, abnormal operational (overcurrent and overvoltage) responses, and hazardous conditions such as shocks. Grounding is necessary to assure correct operation of electrical devices, to assure safety. Power from factory ground must be installed by a qualified electrician. Each DISTRIBUTION BOX and controller must be grounded. 26 mm<sup>2</sup> (10 AWG) ground wire must be used, and in all other markets a 6 mm<sup>2</sup> must be used. It cannot be used or copied for any other. Abstract: System grounding considerations affect many aspects of an electrical system. Whether you're a seasoned pro or just starting out, this comprehensive guide will give you practical. The neutral grounding method is one of the most important elements to consider when utilities plan and operate their distribution system.
