

How can fiber optic cables penetrate walls

Overview

There are a few common ways the fiber drop cable enters a house: Through a Wall: The most common method involves drilling a small hole through an exterior wall of the house. These cables are designed to carry large amounts of data over long distances at incredibly high speeds. Fiber optic technology operates on the principle of total internal reflection, where light is bounced off the cable walls until it reaches the other end. Optical fiber carries signals in the form of light. The good news is that the technique seems to be limited to coils of fiber that are not buried, and you have to be within about 5 meters of the fiber. Each type is designed with specific features to ensure optimal performance under varying conditions. The technician will then connect the cable to an optical network terminal (ONT) or a modem, which converts the optical signal. Installers could opt to staple 5-mm "ruggedized" drop cables using ultra-bend insensitive optical fiber.
