

How to split a single-mode 16-core optical fiber

Overview

A 1×16 PLC splitter, also known as a Planar Lightwave Circuit splitter, is a passive optical device that efficiently divides a single incoming fiber optic signal into sixteen output signals. In contrast to fused fiber couplers, where light is. By dividing a single optical signal from a central Optical Line Terminal (OLT) into multiple outputs for Optical Network Terminals (ONTs) at users' homes, splitters eliminate the need for dedicated fibers to each residence—slashing infrastructure costs while scaling network reach. This guide. This passive device enables a single optical input to be distributed across 16 output fibers, making it a cornerstone in the deployment of fiber-to-the-home (FTTH), passive optical networks (PONs), and other broadband infrastructure. Optical splitter. A splitter is not a filter like a wavelength division multiplexer (WDM). Rarely, there can be two inputs to provide potential redundancy of route.
