The diagram illustrates a repeater system. On the left, a city skyline is shown with several buildings. A yellow lightning bolt, representing a radio signal, originates from a small antenna on the left and points towards a larger antenna mounted on a tall building. This building is labeled 'Repeater' at its base. A vertical mast with a horizontal arm extends from the repeater building towards the right. At the end of this arm is a large, multi-bladed antenna. To the right of the mast, a graph displays the frequency spectrum. The graph's x-axis is labeled 'MHz' and ranges from 140 to 150. The y-axis is labeled 'dBm'. The spectrum shows a series of peaks and valleys, indicating the signal's frequency components. The graph is titled 'Dual Band: 2m / 70cm'.

10GBASE-LR maximum fiber length is 10 kilometers, although this will vary depending on the type of single-mode fiber used. Like previous versions of Ethernet, 10GbE can use either copper or fiber cabling. The implementation of a cabling design, compatible with LED and laser-based Ethernet network devices, which will allow the integration. Yet I am seeing references on the Internet to 40km for 10Gbase-ER as well as stating that 1000base-LX supports 10km and some vendors even offer that up to 20km although it's not in the standard - implying that 10km is actually in the standard for the LX cable. Can anyone advise why the discrepancy. Alternate Name Transmission Speed OM1 (62. 5/125) OM2 (50/125) OM3 (50/125) OM4 (50/125) OS1 (9/125) Let's dig deeper into the numbers for full details of your fiber optic cable range: 1 GB/s Network – An OM1 cable supports 1000BASE-SX up to 275 meters, increasing to 550 meters with an OM2 cable. If you want to reach greater distances of 860 meters, it's probably best to use single mode cable. Many factors decide the fiber cable distance, but the key factors include the below six aspects.
