

Non-contact testing method for optical cables

Overview

Continuity testing is a method for verifying that the optical cable is intact and that there are no breaks or shorts in the fiber. Key tests include: Effective fiber testing utilizes advanced tools such as Optical Loss Test Sets (OLTS), Optical Time-Domain Reflectometers (OTDR), and Visual Fault. Regularly testing fiber optic cables helps minimize network downtime, lengthens the network's longevity, reduces maintenance requirements, and helps support network reconfiguration and upgrades. These factors significantly add to the fiber optic network's long-term performance, manageability, and test methods to be used for testing non-metallic materials of all types of cables. NOTE 1 Non-metallic materials are typically used for insulating, sheathing, bedding, filling or taping. International Standards for fibre testing in customer premises. Latest evolution of the Standards. The numerical aperture (NA) is a measurement of the ability of an optical fiber to capture light.
