

Normal function restored after plugging and unplugging the pigtail

Overview

This video demonstrates the repair of automotive wiring harness connectors, specifically the de-pin and re-pin method used for common pigtails, which can often be damaged, corroded, or broken. The process saves time and money by allowing repairs rather than full component. Here is a fact-based summary of the story contents: When trying to fix a malfunctioning gadget, you've probably read or been told the following: Unplug it, wait 10 seconds, and then plug it back in. Often, that's all it takes to solve the problem. I want to know what happens when I unplug/replug the cable, so I can do it remotely, instead of going all the way to the router. Is there a new IP address assigned?

Or is there more to that?

Can I. Whenever I turn off my pi, I use `sudo poweroff`, which (in my understanding) is a safe way to stop all processes and shut down. Key. Un-plugging and plugging back in resets the OS stored on the machine so it can carry out its original function again. One cause: To be a member of a network, your computer and your cable modem.
