

# Optical Module PCB Structure

## Overview

It consists of a photoelectric converter, driver circuit, receiver circuit, and control circuit. Definition: An Optical Module PCB is the internal circuit board of a transceiver (like SFP, QSFP, or OSFP) responsible for converting electrical signals to optical signals and vice versa. Critical Metrics: Signal integrity (insertion loss, return loss) and thermal management are the two. The Printed Circuit Board (PCB) at the heart of these modules is no longer a simple substrate but a highly engineered system. Designing and producing these complex PCBs presents formidable challenges, requiring a convergence of disciplines—from high-frequency signal integrity and advanced thermal. Optical PCBs [^1] integrate light-based data transmission with electrical circuits using polymer waveguides and photonic chips, enabling 400Gbps+ speeds for 5G networks and AI servers while reducing power consumption by 40% compared to conventional boards. Data rates range from 155 Mbps to 6 Gbps and even up to 10 Gbps.
