

Optical module cage CFP

Overview

A CFP module is a pluggable optical transceiver engineered for high-speed networking applications such as Ethernet, OTN (Optical Transport Network), and SONET/SDH. Form factor: Larger than SFP or QSFP, optimized for high power and long-haul optics. The C form-factor pluggable (CFP, 100G form factor pluggable, where C is Latin: centum "hundred") is a multi-source agreement to produce a common form-factor for the transmission of high-speed digital signals. It plays a fundamental role in converting electrical signals from networking equipment into optical signals—and vice. An eSFP module is an SFP module that supports monitoring of voltage, temperature, bias current, transmit optical power, and receive optical power. Supported speeds: 40G, 100G, and up to 400G. This article breaks down the key differences between CFP, CFP2, CFP4, and CFP8 optical transceivers commonly used in fiber optic networks.) In essence, the progression.
