

PON optical module diagnostics

Overview

The anti-rogueont command detects ONTs which do not send optical signals properly, and isolates ONTs by disabling optical modules. # Detect rouge ONTs on PON 1/0/0. Specifies the type and number of an interface. The PON system parameters allow you to to configure and manage the PON system. It is mainly used to query the alarm monitoring of GPON optical module. AFL's FlexScan TS100 Optical Troubleshooter is an easy-to-use, all-in-one tool for detecting, identifying, locating, and resolving single-mode optical network issues. The. The parameters of optical module include the light transmission power, the light reception power, the temperature, the power-supply voltage and the bias current. The light reception power is for an ONU, that is, it is for a. A PON is a fiber-optic network where signals are transmitted from a central office (head-end or hub) to the end user without needing electrically powered equipment along the way.
