

Relationship between power grid and relay protection

Overview

Traditional relay protection often falls ineffective in power-electronics dominated grids, increasing the risk of mis-operation or operation failure and compromising grid stability. It is reshaping traditional grid architecture and making way for more flexible, efficient and. Fingrid's application guideline for relay protection presents the operating principles of the relay protection in Fingrid's 110, 220 and 400 kV power networks and the requirements for operation of the protection systems of Fingrid customers (hereinafter referred to as 'customer'). The application. Protective relays and devices have been developed over 100 years ago to provide “last line” of defense for the electrical systems. They are intended to quickly identify a fault and isolate it so the balance of the system continue to run under normal conditions. The selection and applications of. able sources such as wind and solar. For example, unselective protection operation during a medium voltage network fault will cause an outage for an unnecessarily large number of consumers.
