

Relay Protection Current Direction Determination

Overview

Directional relays are not just overcurrent devices with extra logic. That single capability is decisive in parallel feeders, ring networks, and multi-infeed grids, where faults may be fed from. Selective short-circuit protection can be achieved in different ways, such as: Time-graded protection Time- and current-graded protection A straightforward way of obtaining selective protection is to use time grading. The principle is to grade the operating times of the relays in such a way that. When addressing the problem of calculating the settings for directional overcurrent elements, the focus is usually the determination of the pickup, time dial and operating characteristic, in order to ensure proper selectivity with adjacent protection elements, thus limiting the problem related to. nd general guidelines, which cannot provide a reliable measure of the suitability of such settings.
