

Relay protection can improve power quality

Overview

Relay protection systems provide better detection accuracy and agility than typical manual inspections or inspections, and they may discover problem locations fast and precisely, increasing the reliability of the entire power system. Protective relays and devices have been developed over 100 years ago to provide “lastline” of defense for the electrical systems. They are intended to quickly identify a fault and isolate it so the balance of the system continue to run under normal conditions. The selection and applications of. able sources such as wind and solar. Long term cost reduction (TCO) for trainings and maintenance by reduce variety of relays A fast and selective arc fault mitigation for air-insulated LV & MV switchgear and Relion protection and control relays and sensor. Although traditional relay protection systems can play a certain protective role, they have some limitations, such as the inability to comprehensively monitor the power system and the lack of accurate judgment.
