

# Requirements for neutral wire connection in distribution boxes

## Overview

According to NEC Article 250, both the neutral and ground wires must be connected only in the main panel or at the first service disconnect. They should never be connected together downstream of the service equipment, such as in subpanels or other parts of the circuits. Always double-check your connections and follow local wiring standards to stay compliant and safe. Messy wires. The installation requirements and specifications of Distribution box involve many aspects, including site selection, fixing method, wiring specifications and safety protection. The following introduces the specific installation methods from three aspects: preparations before installation, installation. Whether the neutral line of each circuit in the distribution box needs to be connected to the neutral block does not depend on the neutral block, but depends on the type of switch in the distribution box.
