

The function of an external optical amplifier

Overview

An optical amplifier amplifies light as it is without converting the optical signal to an electrical signal, and is an extremely important device that supports the long-distance optical communication networks of today. The major types of optical amplifiers include an EDFA, FRA, and. $E(t) + n(t)$ Booster (power) amplifiers: Boost power into transmission fiber, low NF, high Psat. An illustration of the effective gain is given below. Note the presence of a gain peak around 1530nm and. The erbium ions are optically pumped to a higher energy level (typically using a laser at a wavelength of 980nm or 1480nm), and when the incoming optical signal passes through the doped fiber, it stimulates the excited erbium ions to drop to a lower energy level, emitting photons and amplifying the.
