

The quality of fireproof cable trays

Overview

The proper coating and acceptance of fireproof cable trays are essential for long-term performance and safety. This guide explains the tests; however, as an alternative DIN 4102-12 can be used. This is a test for electric cable systems that are required to maintain circuit integrity, so is therefore written around and is dependent on the cables themselves, but contains a minimum of 90 minutes (the maximum time covered by DIN 4102-12). Through these tests the aim was to learn more about thermal conductivity properties in fire conditions and what effects it would have on the tray itself and how long the installed cable. The fire-resistant cable tray and conduit assemblies play a critical role in maintaining safe and compliant industrial operations, particularly within hazardous locations such as chemical plants, oil refineries, and manufacturing facilities. One of the most widely recognized testing standards for fire-resistant cable tray is the Cablofil cable tray is the preferred choice for the cable containment of low and high voltage electric cables where fire resistance is crucial - this includes cable basket tray systems for Prysmian FP (FP400 and FP600) and Draka Firetuf type cables.
