

# Universal optical modules across different switches

## Overview

While many SFP and SFP+ modules share the same physical form factor, true compatibility depends on several technical factors—including port speed, wavelength, fiber type, transmission distance, and whether the switch or router accepts third-party optics. Transceiver compatibility is a key concern in enterprise network deployments. It helps your device connect to a fibre optic or copper cable — like a SIM card for your phone, but for your network. 1, Same wavelength In a fiber optic link, data is transmitted from. SFP (Small Form-factor Pluggable) is a compact, hot-pluggable network interface module used to connect network devices (switches, routers, firewalls) to fiber optic or copper cables. Think of it as the “translator” for your network equipment, converting electrical signals into optical signals. Universal Transceivers have been designed to reliably convert electrical signals to high speed optical data communication.
