Overview

LATICONTHER materials are injection-moldable thermoplastics, consisting of technical polymers filled with large quantities of thermally conductive fillers. LATI's thermally conductive materials from the LATICONTHER range represent an alternative to metals for heat transfer. Thanks to the presence of functional fillers such as graphite and special ceramics, our compounds achieve thermal conductivities exceeding 30 W/mK, while maintaining the typical. XG-5400 series thermally conductive clay is a silicone-based thermally conductive thermal filler with a thermal conductivity of 1. These. With the production of various thermal materials: High thermal conductivity silicone film, thermal double-sided adhesive, thermal conductivity of silicone films, phase change materials, silicone cap sets, thermal graphite, thermal conductivity ceramic, thermal grease and other thermal interface. There is a growing demand for thermal management of components, devices and systems in established and emerging areas such as electronics, LED lighting and battery technology/e-powertrain. Metals are traditionally utilised here for applications such as heat sinks, housings and covers, but there are.
